Rationale

Charlson et al. (1987) synthesis of previous work on aerosol effects upon cloud microphysical properties \Rightarrow

dimethyl sulfide-cloud condensation nuclei-
cloud albedo-climate connection

Charlson et al. (1991) : model calculation of direct radiative impact of anthropogenic sulfate aerosol on global albedo \Rightarrow

suggests average $-1.1 \text{ watts m}^{-2}$ over northern hemisphere

Current Measurement Program at Cape Grim

1. DMS*
2. Hivol aerosol* MSA and nss-SO₄
3. Sub- μ m aerosol MSA and nss-SO₄
4. Rainwater* MSA (and nss-SO₄)
5. SO₂
6. COS & H₂S under development*

* carried out at AGAL

In addition, aerosol microphysical properties, CN and CCN concentrations, aerosol optical properties are determined in the Cape Grim Aerosol Program (J.Gras).

Data Records to Date

1. Hivol components 1976 - present
2. Rainwater components 1976 - present
3. DMS Nov. 1988 - present
4. Sub- μm aerosol components Nov. 1988 - present
5. SO_2 Nov. 1990 - present
6. COS and H_2S , under development

Methods

1. Hivol : (baseline switched)
 - 10 inch x 8 inch Pallflex teflon-composite filter, at 700-800 L min⁻¹, weekly-average sample, IC and AA analysis.
2. Quadrupod (sub- μ m) filters : (baseline switched)
 - 47 mm 8 μ m Nuclepore filter followed by 47 mm 1 μ m Flouropore filter, at 30 L min⁻¹, weekly-average sample, IC analysis
3. DMS : (baseline selected)
 - trapping onto a gold surface sputter-coated onto glass wool, at 1 L min⁻¹, weekly-average and 1 hour-average samples, capillary GC analysis
4. SO₂ : (baseline switched) :
 - 1 μ m cut-off impactor, followed by 47 mm 1 μ m Flouropore filter, then 47 mm glass-fibre filter impregnated with NA₂CO₃, at 30 L min⁻¹, weekly-average, IC analysis

M. Raupach (CSIRO)

EDDY CORRELATION

1. Principle: $F_c = \overline{w p_c} = \overline{w} \overline{p_c} + \overline{w' p_c'}$

2. Bandwidth: $10^{-3} < n < 10$

$$n = fz/\bar{u}$$

f = frequency

z = height

\bar{u} = mean wind speed

3. Webb-Pearman-Leuning effect

4. Sampling along a tube

5. Platform motion

6. Avoiding eddy correlation:
inverse methods for
inferring F_c from $\overline{p_c}$

LAKE ALBERT, SOUTH AUSTRALIA, APRIL 1975

LAKE ALBERT, SOUTH AUSTRALIA, 1975

Figure 8. The wq , uq and uw cospectra. The data are grouped in stability bands thus:
 band A: $0.11 < -z/L < 0.18$ (4 runs)
 band B: $0.18 < -z/L < 0.21$ (3 runs)
 band C: $0.27 < -z/L < 0.63$ (5 runs)

WEBB - PEARMAN - LEUNING (WPL) EFFECT

Vertical flux of dry air = $\overline{w p_a} = 0$

$$\Rightarrow \overline{w p_a} + \overline{w' p'_a} = 0$$

$$\Rightarrow \overline{w} = - \overline{w' p'_a} / \overline{p_a}$$

($\overline{w} > 0$ in convection)

For a trace scalar:

$$F_c = \overline{w p_c} = \overline{w p_c} + \overline{w' p'_c}$$

(mass flux) (density) WPL correction

Open path sensor (with temp fluctuations):

$$\overline{w p_c} = \overline{p_c} \left[\overline{w' m'} + (1 + \overline{m}) \frac{\overline{w' \theta'}}{\overline{T}} \right]$$

Closed path sensor (temp fluctuations removed):

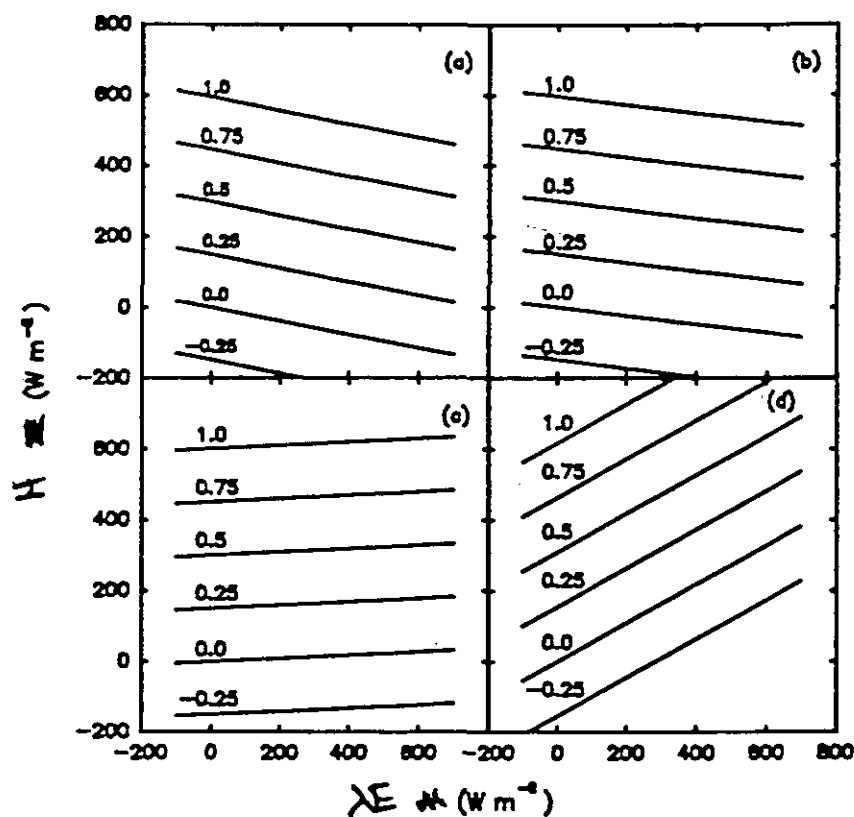

$$\overline{w p_c} = \overline{p_c} \left[\overline{w' m'} + \overline{m} \frac{\overline{w' \theta'}}{\overline{T}} \right]$$

with $m = \text{H}_2\text{O}$ molar mixing ratio.

$\overline{w p_c} / F_c$ range:

-0.1 to -1	(CO ₂)
0.25 to 0.10	(N ₂ O)
0.04 to 0.6	(CH ₄)

LEUNING AND MONCRIEFF (1990)

$\bar{w} \bar{p}_c$ for CO_2
($\text{mg m}^{-2} \text{ s}^{-1}$)

$a \rightarrow b \rightarrow c \rightarrow d$
represents
increasing
 H_2O cross-
sensitivity

Fig. 2. Isopleths for the correction to measured CO_2 fluxes as a function of latent and sensible heat fluxes for open-path CO_2 analysers with differing cross-sensitivity to water vapour. (a) $\beta/\alpha = 0$, (b) $\beta/\alpha = 3 \times 10^{-4}$, (c) $\beta/\alpha = 1 \times 10^{-3}$ and (d) $\beta/\alpha = 3 \times 10^{-3}$. Numbers on the lines represent the flux correction to be added to F_{raw} ($\text{mg CO}_2 \text{ m}^{-2} \text{ s}^{-1}$). Corrections at $H = 0$ also apply to closed-path CO_2 analyser.

SAMPLING THROUGH A TUBE

Lenschow and Raupach, J. Geophys. Res. (1991)
96, 15259-68.

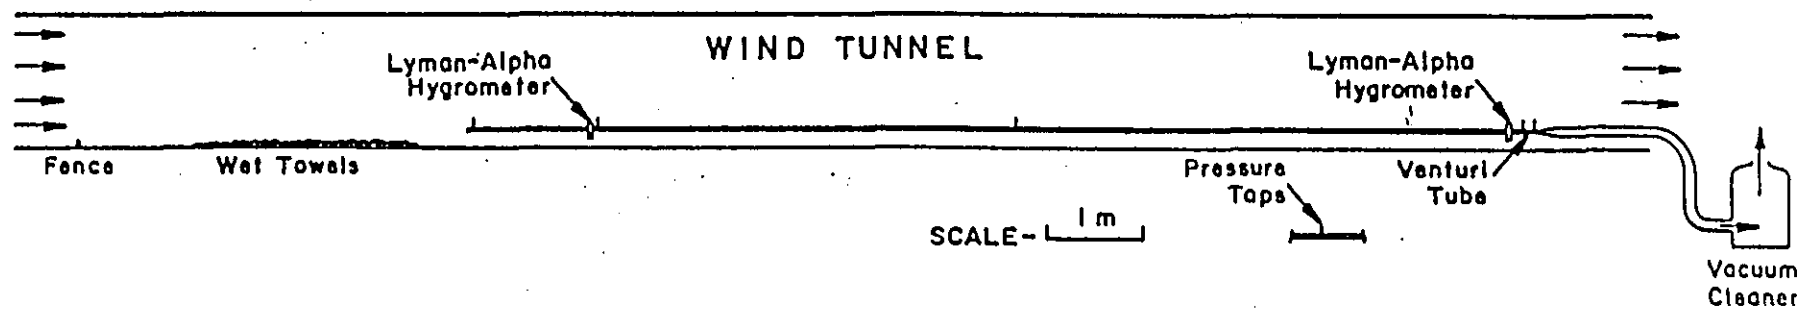

Tube transfer function:

$$\Phi(n) = \frac{\text{amplitude out}}{\text{amplitude in}} = \exp\left(\frac{-n^2 \ln \sqrt{2}}{n_0^2}\right)$$

$$n = \frac{f}{U} \sqrt{aX} = \text{dimensionless frequency}$$

$$n_0 = \begin{cases} 0.92 (\text{Re Sc})^{-1/2} & (\text{laminar}) \\ 0.066 \text{Re}^{1/6} & (\text{turbulent}) \end{cases}$$

Desirable: turbulent flow in tube!
HIGH measurement point!

LEUNING AND MONCRIEFF (1990)

EDDY-COVARIANCE CO₂ MEASUREMENTS USING OPEN- AND CLOSED-PATH CO₂ ANALYSERS

73

Fig. 3. Estimated percentage loss in measured F_{raw} for a closed-path CO₂ analyser supplied with air sampled through a copper tube $L = 1.5$ m, $r_0 = 3$ mm and $V = 8 \times 10^{-3} \text{ m}^3 \text{ s}^{-1}$. Separation distance between tube inlet and sonic anemometer was 0.18 m. Losses are plotted against windspeed for sensor heights of 1 and 4 m above the zero-plane. Flux losses due to damping of turbulence fluctuations by tube only (.....); flux losses due to limited sensor frequency response but neglecting effect of tube (----) and combined influence of tube and sensor frequency response (—).

Correction for ship motion:
Shao, Bradley, Coppin (current work)

Sonic and Corrected Wind: Sonic1-0535

Sonic 1-0535

INVERSE METHODS

- inferring fluxes from mean concentrations

1. Canopy scale

$$\underbrace{C_i - C_r}_{\substack{\text{concentration} \\ \text{at level } i}} = \sum_{j=1}^m \underbrace{D_{ij}}_{\substack{\text{dispersion matrix:} \\ \text{depends on } \sigma_w, T_L}} \underbrace{S_j \Delta z_j}_{\substack{\text{source strength} \\ \text{in layer } j}}$$

2. Scale of planetary convective B.L. CBL well mixed

$$\frac{dC}{dt} = \frac{F_c}{h} + (C_+ - C) \frac{dh}{dt}$$

$$\Rightarrow \int_0^t F_c dt = (C - C_+) h(t)$$

(with assumptions)

**DEVELOPMENT OF A GAS CHROMATOGRAPHIC METHOD
FOR THE ANALYSIS OF
ATMOSPHERIC DIMETHYLSULPHIDE**

ABSTRACT

This report covers the development of the Dimethylsulphide analysis project of the Sulphur Program at the Australian Baseline Air Pollution Station, Cape Grim. It seeks to document the analytical rationale behind the choice of methodology and presents the steps taken to ensure the analytical credibility of the published results. Peculiarities of the gold trapping methodology developed, and the effect of oxidants on trapping efficiency are discussed. The chromatography of DMS with respect to potential interference and the quantitation of that gas against reference standards are described. Examples of quantitation of DMS at atmospheric concentrations are presented and the future directions of the analytical program explained.

DMS ANALYSIS PROGRAM AT CAPE GRIM

(1) Insitu Day/ Night Grab Samples

60L of air is sampled through a chemisorptive gold sputter coated glass wool containing tube. Oxidants are removed from the sampling line by reaction on a KI/Glycerine coated G/F filter. DMS is then thermally desorbed to a cryogenic loop at the AGAL laboratory and injected into a Dani 6500 gas chromatograph. Column used is a DB1 0.53 IDx 25Mx 5.0um capillary column, a flame photometric detector provides sulphur specific quantitation. Permiation tubes are used for standards.

(2) Integrated DMS Sampling

Air is sampled at 40ml/min. during periods of Baseline conditions through a larger (125cc instead of 20cc) gold trap. The sampling exactly parallels collections of SO₂ and air particulates by high volume filter. The analyses are undertaken in the same manner as the insitu collections.

Table 1

Comparison of the oxidant capacity of several scrubbing systems.

<u>Oxidant Removal Material</u>	<u>Breakthrough Volume</u> (litres)
Untreated glass fibre (G/F) filter	14
Water rinsed G/F filter	12
NaOH (7%) on G/F filter	48
KOH (7%) on G/F filter	75
Na ₂ CO ₃ (7%) on G/F filter	35
Na ₂ CO ₃ on Chromosorb W-AW in Pyrex tube	26
MnO ₂ granules in Pyrex tube	25
Vitex (0.5%) on G/F filter	45
Glycerol (5%) on G/F filter	19
KI (5%) on G/F filter	25
Glycerol/Vitex (5%/0.5%) on G/F filter	25
KI/Vitex (5%/0.5%) on G/F filter	64
KI/glycerol (5%/5%) on G/F filter	193
KI/gly/V (5%/5%/0.5%) on G/F filter	263

TRAP A

FIG 1

LIMITATIONS OF GOLD TRAPPING

- (1) Specific for DMS (other sulphur compounds give variable recoveries and react during hydrogen desorption.
- (2) Too dependent on operator. (6 out of 14 weekly samples lost through operator/sampling error.)
- (3) Fragility of glass samplers.
- (4) Potential for leaks.(Not easily detectable)

CURRENT RESEARCH AND PROGRAM UPGRADE

Unattended GC Analysis at CG

In the current year a GC will be installed at CG to measure DMS and COS continuously. This instrument will be based on oxidant removal by KI filters, 1L air trapping on tenax with GC separation and detection via Hall conductivity in the sulphur mode.

Important elements for success

- (1) Calibration by gas standards including SF₆ as internal standard.
- (2) Cylinder sampling for AED determination at AGAL using identical cylinder standards.
- (3) Variable DMS standard introduction (due to large seasonal variation).
- (4) Reliability, linearity of calibration and reproducibility.
- (5) Bracketing standards ie 490& 520ppt for COS (atmospheric conc. ~505ppt).
